KESHAV ACHARYA

keshav.ach@outlook.com | linkedin.com/in/keshavach | github.com/keshava1

EDUCATION

University of Washington • Seattle, WA **Graduation: June 2027**
B.S. in Computer Science; B.S. in Economics *GPA: 3.84*

EXPERIENCE

Atoms **September 2026 – Present**
Software Engineering Intern *Seattle, WA*

- Developing an automated web-scraping pipeline that aggregates data from multiple sources for business insights.

ZipRecruiter **June 2026 – September 2026**
Software Engineering Intern, Applicant Engagement *Santa Monica, CA*

- Designed and shipped a full-stack feature anchoring each message thread to a primary job application, a backend concept now consumed by adjacent features and analytics on a two-sided platform handling ≈70,000 messages/day.
- Let job seekers review the roles they had applied to without leaving the conversation, replacing a redirect out to the external job posting site with an in-context view that now serves ≈8,000 weekly interactions.
- Owned the gated rollout, implementing server-side feature-gating and ramping to 100% of users with no regressions, and instrumented the launch with dedicated analytics and observability plans built alongside a data science team.

Electric Era **April – June 2026**
Software Engineering Intern *Seattle, WA*

- Built control systems including dynamic thermal controls for a control enclosure and refactored a legacy Go network management service into C++, reducing CPU use by $\approx 30\%$ while improving recovery from network fault scenarios.
- Built a customer-facing failed-session troubleshooting UI flow that parsed diagnostic error data directly from charger hardware and generated guided recovery steps tailored to the detected failure state.
- Continued ownership of the OCPI platform, refactoring production services and completing 2 third-party integrations.

Electric Era **April – September 2025**
Software Engineering Intern *Seattle, WA*

- Designed, implemented, and owned an OCPI interoperability platform in NestJS and TypeORM, synchronizing live status and charging-session data from 100+ EV chargers to multiple external e-Mobility Service Providers.
- Built end-to-end remote start and stop flows for charging sessions spanning cloud services and charger hardware, with real-time status updates and reliable operation during intermittent internet connectivity.
- Engineered three C++ over-the-air firmware update pipelines using serial, Modbus, and FTP interfaces, with validation and rollback support that reduced the time required to update firmware for deployed chargers in the field.
- Engineered an RFID payment flow across physical payment terminals, charger hardware, and backend services, using cloud authorization to enable a new payment method for customers.

Paul G. Allen School of Computer Science and Engineering **March – June 2025**
Undergraduate Student Researcher *Seattle, WA*

- Built a privacy-preserving verification flow in Go using the Origo framework, zero-knowledge proofs, and TLS oracles, and applied it to a discussion forum that authenticated eligible users without storing/exposing personal identifiers.

PROJECTS

Fault-Tolerant Distributed Key-Value Store

- Built a linearizable, fault-tolerant sharded key-value store in Java using Multi-Paxos. Implemented features for efficiency and reliability on top of normal Multi-Paxos, including log compaction and transactions (with 2PC and locking).

Appearance-Based Bias in Visual Representations

- Built an end-to-end computer vision and NLP pipeline over approximately 500 public figures using aligned face crops and Reddit sentiment data; evaluated 349 identities and found standalone demographic attributes outperformed VQ-VAE-2 and ResNet-50 appearance features, indicating the apparent predictive signal largely reflected demographic bias.

TECHNICAL SKILLS

Languages / Frameworks: C++, Go, Java, TypeScript, Python, C, SQL, HTML, CSS, NestJS, React, Spring Boot, TypeORM
Tools: Docker, Kubernetes, PostgreSQL, Microsoft Azure, GitLab CI/CD, Git, Bazel, Rush, Protobuf
